

Proposed Solution

Executive Summary

A comprehensive data visualization project utilizing Tableau to analyze the "Impact of Product Positioning on Sales." The solution transforms raw Kaggle CSV data into an interactive Dashboard containing 8 key charts and a 3-scene Storyboard, empowering retail managers to make data-driven decisions regarding store layouts and promotions.

Core Features

1. **Interactive Dashboard:** A grey-themed, fixed-layout dashboard featuring 8 distinct charts (Bar, Donut, Stacked, Bubble, Pie) covering sales volume, pricing, and demographics.
2. **Dynamic Filtering:** 3 global filter checklists (Consumer Demographics, Product Category, Product Position) that instantly update all 8 visualizations simultaneously.
3. **Data Storyboarding:** A 3-scene Tableau Story that walks stakeholders through critical insights, focusing on the strong performance of the "Clothing" category, especially in high-traffic "Front of Store" positions.

User Benefits

- **Time Savings:** Eliminates the need to manually parse spreadsheets to find sales trends.
- **Improved Decision Making:** Provides clear visual evidence to

justify moving specific product categories to end-caps or the front of the store.

- **Enhanced Communication:** Storyboards allow analysts to present findings to non-technical executives effortlessly.
