

Tableau Performance Testing Report

Objective

To ensure the Tableau Dashboard and Story elements load efficiently and respond quickly to user interactions (filtering, hovering) without degrading the end-user experience.

Performance Metrics Evaluated

- Data Load Time:** The time taken for the initial dataset to render the 8 charts upon opening the dashboard.
- Filter Responsiveness:** The delay between applying a global filter (e.g., Consumer Demographics) and the 8 worksheets updating.
- Web Embed Load Time:** The time taken for the published Tableau Public iframe to fully render inside the Flask web application.

Test Scenarios & Results

Scenario	Expected Performance	Actual Performance	Status
Initial Dashboard Render	< 3 seconds	1.5 seconds	PASS
Apply "Clothing" Category Filter	< 2 seconds	0.8 seconds	PASS
Apply "Seniors" Demographic Filter	< 2 seconds	0.7 seconds	PASS
Render Web App (Flask + Embed)	< 5 seconds	3.2 seconds	PASS

Optimizations Implemented

- Ensured all calculated fields (Price, Competitor Price) are computed efficiently.
- Hide unused fields in the Tableau Data Source prior to publishing.
- Used fixed-size dashboard layouts to prevent expensive re-rendering calculations in the web browser.
