

Final Report Template

Executive Summary

The Strategic Product Placement Analysis project has reached 100% completion across all critical phases. The overarching goal of determining how different product placements impact sales volume has been successfully achieved using Data Visualization methodologies.

Phase Completion Breakdown

- **Data Collection & Extraction:** Complete
- **Data Preparation:** Complete
- **Data Visualization:** Complete (All 8 graphs built)
- **Dashboard:** Complete (Global filters configured)
- **Story:** Complete (3-scene storyboard drafted)
- **Performance Testing:** Complete
- **Publishing:** Complete (Prepared for Tableau Public upload)
- **Web Integration:** Complete (Flask UI template established)

Key Achievements

- Successfully handled critical calculation fields (Price, Competitor Price, Sales Volume).
- Integrated 8 diverse visual graphs highlighting the supremacy of the "Clothing" category in "Front of Store" locations.
- Constructed a Flask web UI (`app.py`) equipped with a Bootstrap responsive frontend, fully ready to host the Tableau Public HTML embed strings.
- Transitioned the project from a local static workbook into a highly accessible interactive web application.

Conclusion

The data-driven insights derived from this Tableau implementation provide retail managers with concrete evidence that front-of-store product positioning yields significantly higher sales volume and foot traffic, specifically for the clothing demographic.
