

Problem Statement Definition

The Problem

Retail stores struggle to optimize product placement (Aisle, End-cap, Front of Store) without concrete data, leading to suboptimal sales performance and inefficient use of high-foot-traffic areas.

Who is affected?

Store Managers, Merchandisers, and Retail Analysts who are responsible for product positioning and maximizing revenue per square foot.

What is the impact?

Poor product placement decisions result in lower overall average sales volume, missed promotional opportunities, and a failure to capitalize on specific consumer demographics' buying habits.

Proposed Solution Concept

A Strategic Product Placement Analysis project utilizing a dataset from Kaggle to build a comprehensive, interactive Tableau Dashboard and Storyboard. This solution will visualize key metrics like Average Sales Volume by Product Category, Product Position, and Season, alongside

Competitor Price analysis, enabling data-driven placement decisions.
